How To - Jira Configuration

1. Download Jira

Download the installer for your operating system .

- Jira Core at   https://www.atlassian.com/software/jira/core/download
- Jira Software at https://www.atlassian.com/software/jira/download
- Jira Service Desk at https://www.atlassian.com/software/jira/service-desk/download

2. Run the installer

1. Run the installer , You'll be asked for the following info:
   a. **Destination directory** – this is where Jira will be installed.
   b. **Home directory** – this is where Jira data like logs, search indexes and files will be stored.
   c. **TCP ports** – these are the HTTP connector port and control port Jira will run on. Stick with the default unless you're running another application on the same port.
   d. **Install as service** – this option is only available if you ran the installer as administrator.
2. Jira will start up in your browser once installation is complete.

Set up your Jira application

3. Choose set up method

Choose **I'll set it up myself**.

4. Connect to your database

1. Choose **My own database**.
2. Choose your database type then enter the details for your database.

5. Set application properties

1. Give your Jira site a name.
2. Choose wether your site should is private or if anyone can sign up. You can change this later.
3. Enter your base URL - this is the address people will use to access your Jira site.

6. Enter your license

7. Create your administrator account

Enter details for the administrator account. You can add more administrators after set up is complete.

8. Set up email notifications

Enter details of your mail server. This will allow Jira to send notifications when issues change.

9. Start using Jira
